AgriProof: Onchain Agriculture Tokenization

Project Vision

AgriProof is a blockchain-powered protocol that transforms real-world agricultural activities into tokenized onchain rewards. Farmers submit activity data (daily, weekly, or monthly), which is evaluated by an AI engine. Based on this analysis, users earn points that are then converted into blockchain tokens.

The goal is to create a decentralized system of agricultural proof-of-work, enabling farmers to benefit from their real-world efforts while also building transparent, verifiable onchain data.
